Health Summary Report of the Shiparc Application Home Page

The home page is in a moderately concerning state, with one active runtime error and several recurring warnings firing on every single page load. The most serious issue is **ERR-005**, where the Content Security Policy is blocking Cloudflare Turnstile's use of **eval()** - means the bot-protection and CAPTCHA layer is silently broken for all users, posing both a security and functionality risk. Compounding this, **ERR-001** and **ERR-003** reveal that the **companyCreatedAt** field is consistently failing to parse, causing the app to silently fall back to a default "last 12 months" date range; since this affects dashboard filtering, users may be viewing inaccurate data without any visible indication that something is wrong. On the less critical side, **ERR-002** and **ERR-004** flag outdated MUI import paths; while these carry no immediate user-facing impact, they represent technical debt that will cause breaking changes during any future MUI upgrade. The fact that all five errors appear on every page load suggests these are systemic issues.

Overall, the page is functional on the surface but quietly degraded underneath as the silent failures in security validation and date-based data filtering are particularly risky as they erode trust in the product without users realizing it. Immediate attention should be directed at the CSP configuration and the **companyCreatedAt** data handling before addressing the deprecation warnings in a routine cleanup sprint.
